Design a Movie Ticket Booking System

We'll cover the following

- Requirements and Goals of the System
- Use case diagram
- Class diagram
-
- Activity Diagram
- Code
- Concurrency

An online movie ticket booking system facilitates the purchasing of movie tickets to its customers. E-ticketing systems allow customers to browse through movies currently playing and book seats, anywhere and anytime.

Requirements and Goals of the System

#

Our ticket booking service should meet the following requirements:

1. It should be able to list the cities where affiliate cinemas are located.
2. Each cinema can have multiple halls and each hall can run one movie show at a time.
3. Each Movie will have multiple shows.

4. Customers should be able to search movies by their title, language, genre, release date, and city name.

5. Once the customer selects a movie, the service should display the cinemas running that movie and its available shows.
6. The customer should be able to select a show at a particular cinema and book their tickets.
7. The service should show the customer the seating arrangement of the cinema hall. The customer should be able to select multiple seats according to their preference.
8. The customer should be able to distinguish between available seats and booked ones.
9. The system should send notifications whenever there is a new movie, as well as when a booking is made or canceled.
10. Customers of our system should be able to pay with credit cards or cash.
11. The system should ensure that no two customers can reserve the same seat.
12. Customers should be able to add a discount coupon to their payment.

We have five main Actors in our system:

- **Admin:** Responsible for adding new movies and their shows, canceling any movie or show, blocking/unblocking customers, etc.
- **FrontDeskOfficer:** Can book/cancel tickets.
- **Customer:** Can view movie schedules, book, and cancel tickets.
- **Guest:** All guests can search movies but to book seats they have to become a registered member.
- **System:** Mainly responsible for sending notifications for new movies, bookings, cancellations, etc.

Here are the top use cases of the Movie Ticket Booking System:

- **Search movies:** To search movies by title, genre, language, release date, and city name.
- **Create/Modify/View booking:** To book a movie show ticket, cancel it or view details about the show.
- **Make payment for booking:** To pay for the booking.
- **Add a coupon to the payment:** To add a discount coupon to the payment.

Here are the main classes of the Movie Ticket Booking System:

- **Account:** Admin will be able to add/remove movies and shows, as well as block/unblock accounts. Customers can search for movies and make bookings for shows. FrontDeskOffice can book tickets for movie shows.
- **Guest:** Guests can search and view movies descriptions. To make a booking for a show they have to become a registered member.
- **Cinema:** The main part of the organization for which this software has been designed. It has attributes like 'name' to distinguish it from other cinemas.
- **CinemaHall:** Each cinema will have multiple halls containing multiple seats.
- **City:** Each city can have multiple cinemas.
- **Movie:** The main entity of the system. Movies have attributes like title, description, language, genre, release date, city name, etc.
- **Show:** Each movie can have many shows; each show will be played in a cinema hall.

- **CinemaHallSeat:** Each cinema hall will have many seats.

- **ShowSeat:** Each ShowSeat will correspond to a movie Show and a CinemaHallSeat. Customers will make a booking against a ShowSeat.

- **Booking:** A booking is against a movie show and has attributes like a unique booking number, number of seats, and status.

- **Payment:** Responsible for collecting payments from customers.

- **Notification:** Will take care of sending notifications to customers.

UML conventions

Interface: Classes implement interfaces, denoted by Generalization.

Class: Every class can have properties and methods.
Abstract classes are identified by their *Italic* names.

Generalization: A implements B.

Inheritance: A inherits from B. A "is-a" B.

Use Interface: A uses interface B.

Association: A and B call each other.

Uni-directional Association: A can call B, but not vice versa.

Aggregation: A "has-an" instance of B. B can exist without A.

Composition: A "has-an" instance of B. B cannot exist without A.

Activity Diagram

- **Make a booking:** Any customer can perform this activity.

How to handle concurrency; such that no two users are able to book the same seat? We can use transactions in SQL databases to

avoid any clashes. For example, if we are using SQL server we can utilize Transaction Isolation Levels (<https://docs.microsoft.com/en-us/sql/odbc/reference/develop-app/transaction-isolation-levels>) to lock the rows before we update them. Note: within a transaction, if we read rows we get a write-lock on them so that they can't be updated by anyone else. Here is the sample code:

```
SET TRANSACTION ISOLATION LEVEL SERIALIZABLE;
```

```
BEGIN TRANSACTION;
```

```
-- Suppose we intend to reserve three seats (IDs: 54, 55, 56) for ShowID=99
Select * From ShowSeat where ShowID=99 && ShowSeatID
in (54, 55, 56) && isReserved=0
```

```
-- if the number of rows returned by the above statem
ent is NOT three, we can return failure to the user.
update ShowSeat table...
update Booking table ...
```

```
COMMIT TRANSACTION;
```

PK

‘Serializable’ is the highest isolation level and guarantees safety from Dirty

([https://en.wikipedia.org/wiki/Isolation_\(database_systems\)#Dirty_reads](https://en.wikipedia.org/wiki/Isolation_(database_systems)#Dirty_reads)), Nonrepeatable

([https://en.wikipedia.org/wiki/Isolation_\(database_systems\)#Non-repeatable_reads](https://en.wikipedia.org/wiki/Isolation_(database_systems)#Non-repeatable_reads)), and Phantoms

([https://en.wikipedia.org/wiki/Isolation_\(database_systems\)#Phantom_reads](https://en.wikipedia.org/wiki/Isolation_(database_systems)#Phantom_reads)) reads.

Once the above database transaction is successful, we can safely assume that the reservation has been marked successfully and no two customers will be able to reserve the same seat.

Here is the sample Java code:
